Plastics – the Facts 2018
An analysis of European plastics production, demand and waste data
Plastics – the Facts is an analysis of the data related to the production, demand and waste management of plastic materials. It provides the latest business information on production and demand, trade, recovery as well as employment and turnover in the plastics industry. In short, this report gives an insight into the industry’s contribution to European economic growth and prosperity throughout the life cycle of the material.
The data presented in this report was collected by PlasticsEurope (the Association of Plastics Manufacturers in Europe) and EPRO (the European Association of Plastics Recycling and Recovery Organisations). PlasticsEurope’s Market Research and Statistics Group (PEMRG) provided input on the production and the demand of plastic raw materials. Conversio Market & Strategy GmbH helped assess waste collection and recovery data. Official statistics from European or national authorities and waste management organisations have been used for recovery and trade data, where available. Research or expertise from consultants completed gaps.

Figures cannot always be directly compared with those of previous years due to changes in estimates. Some estimates from previous years have been revised in order to track progress, e.g. for use and recovery of plastics across Europe over the past decade.

All figures and graphs in this report show data for EU-28 plus Norway and Switzerland, which is referred to as Europe for the purposes of abbreviation –other country groups are explicitly listed.
Circularity at the heart of Europe’s economic transformation

The European Commission aims at transforming Europe into a more circular and resource efficient economy. PlasticsEurope fully supports this objective and believes plastic materials can help to achieve it.

It is widely recognised that plastics have a crucial role to play in delivering a more sustainable future. Through their unique combination of light-weight, durability and other intrinsic properties, plastic materials already contribute to reduce GHG emissions making a more efficient use of our resources across a range of different sectors and everyday applications. As a result of their versatility and capacity for innovation, our materials are also invariably best placed to support breakthrough sustainable technologies in areas such as sustainable mobility, smart and efficient building, sustainable agriculture, food conservation or in the healthcare and medical sector, to name only a few.

However, challenges relating to littering and end-of-life options for certain types of plastics waste —especially packaging waste— must be addressed if the material is to achieve its fullest potential in a circular and resource efficient economy.

It is in this spirit of commitment to future generations, that PlasticsEurope has decided to set a series of ambitious targets and initiatives up to 2030 that are focussed on the key areas of preventing leakage of plastics into the environment, improving resource efficiency and increasing recycling and reuse rates.

With its Voluntary Commitment “Plastics 2030”, PlasticsEurope is advancing the plastics industry’s role to a next level of engagement, recognising that this transformation will only take place through solutions put into reality and through the regulatory support of the EU institutions.
“Plastics 2030”: making Circularity and Resource Efficiency a Reality

The Plastics 2030 Voluntary Commitment focuses on preventing leakage of plastics into the environment, on improving resource efficiency and the circularity of plastic packaging applications.

**Overarching goals**

1. Prevent leakage of plastics into the environment.
2. Improve resource efficiency.
3. Improve circularity of plastic packaging.

**Targets**

- By increasing engagement inside and outside our industry.
- By accelerating innovation in the full life cycle of products.
- By reaching in 2040 100% reuse, recycling and/or recovery of all plastic packaging in the whole EU. In 2030: 60% reuse and recycling of all plastic packaging.

**All play a role in a circular economy**

- Building and construction
- Electronics
- Light-weight vehicles
- Health
- Packaging
- Energy

Different plastics for different products
Plastics make a very efficient use of resources, especially during the use phase. At the end of their life, plastics are still very valuable resources that can be transformed into new feedstock or into energy.
“Plastics 2030”: making Circularity and Resource Efficiency a Reality

General commitments

Prevent the leakage of plastics into the environment
• Prevent littering: identification and littering prevention solution of most found items into the environment.
• Prevent pellet loss:

 Improve resource efficiency and circularity of plastics
• Accelerate research of alternative feedstocks.
• Product Life Cycle Inventory: update of datasets every three years.
• Extension of waste data collection, including new data on circularity of plastics.
• Eco-design guidelines for plastic packaging finalised by 2020.
• Support standardisation for quality standards for sorted plastics.

Global Initiatives

Global Plastics Alliance
Marine Litter Solutions: 355 projects in 47 countries.

World Plastics Council
Support of global initiatives and cooperation with UNEP, G7/G20.

www.opcleansweep.eu

www.marinelittersolutions.com

www.worldplasticscouncil.org
**Sector-specific commitments**

- Development of packaging design guidelines and assessment protocols according to the principles of the Circular Economy.
- Innovation and standardisation to increase the recyclability of polyolefin packaging.
- EU wide quality standards for pre-sorted plastic waste, harmonisation of test methods for recycled plastic materials and certification of plastic recycling operations.
- Innovation & development of end-use markets to stimulate reuse and encourage demand for recycled plastics.
- Stimulating innovation to improve recycling, conversion technologies and reuse.

- Develop technologies to recycle PS/EPS back into original applications.
- Collaborate with value chain to improve collection and sorting systems for packaging waste.
- Create an independent structure to finance promising technologies. [www.styrenics-circular-solutions.com](http://www.styrenics-circular-solutions.com)

- Within the framework of VinylPlus ([www.vinylplus.eu](http://www.vinylplus.eu)) further advance and increase safe and quality PVC recycling for all PVC applications.
- Continue developing eco-efficient PVC packaging materials, increasing shelf life of the packed products.

**Reporting**

- Monitoring the progress of the voluntary commitment.
- Action plan and time-based performance indicators.
- Yearly evaluation provided by independent committee.
CONTRIBUTION TO EUROPEAN SOCIETY
Key figures of the European plastic industry

The European plastic industry includes plastics raw materials producers, plastics converters, plastics recyclers and plastics machinery manufacturers in the EU28 Member States.

**Over 1.5 million people**

The plastic industry gives direct employment to more than 1.5 million people in Europe

**Close to 60,000 companies**

An industry in which close to 60,000 companies operate, most of them SME’s

**More than 350 billion euros**

The European plastic industry had a turnover of 355 billion euros in 2017

**17 billion euros**

The European plastic industry had a trade balance of more than 17 billion euros in 2017*

* Data including only plastics raw materials producers and plastics converters
More than 30 billion euros
The European plastic industry contributed to 32.5 billion euros to public finances and welfare in 2017

x2.4 in GDP and almost x3 in jobs
The European plastic industry has a multiplier effect of 2.4 in GDP and almost 3 in jobs*

* The European House Ambrosetti study, data for Italy, 2013

7th in Europe
The European plastic industry ranks 7th in Europe in industrial value added contribution. At the same level as the pharmaceutical industry* and very close to the chemical industry

* Measured by gross value added at factor prices, 2013

Over 8.4 million tonnes
In 2016, over 8.4 million tonnes of plastic waste were collected in order to be recycled inside and outside the EU
Plastic or Plastics?

Plastic is a term derived from the Latin “plasticus” which is derived from the Greek “plastikos” that was used to describe something able to be molded or fit for molding. This terminology was actually used already in the 17th century, long before the first plastic material, Parkesine, was invented.

Today “plastics” or “plastic materials” are the terms used to describe an extremely large family of very different materials with different characteristics, properties and uses.

Thanks to their versatility and innovation capacity, plastic materials can offer customized solutions to a wide variety of needs in innumerable products, applications and sectors.

Plastics are not just one material, but a wide family of different materials. Today they can be fossil-based or bio-based and in both cases they can also be bio-degradable.
Discovering the wide family of plastics

The plastics’ family is composed of a great variety of materials designed to meet the very different needs of thousands of end products.

The two categories of plastics

### Thermoplastics

- Polyethylene (PE)
- Polypropylene (PP)
- Polyvinyl-chloride (PVC)
- Polyethylene Terephthalate (PET)
- Polystyrene (PS)
- Expanded polystyrene (EPS)
- ABS
- SAN
- Polyamides (PA)

- Polycarbonate (PC)
- Poly methyl methacrylate (PMMA)
- Thermoplastic elastomers (TPE)
- Polyclaryl sulfone (PSU)
- Fluoropolymers
- PEEK
- POM
- PBT
- Etc.

### Thermosets

- Polyurethane (PUR)
- Unsaturated polyester
- Epoxy resins
- Melamine resin
- Vinyl ester
- Silicone
- Phenol - formaldehyde
- Urea - formaldehyde
- Phenolic resins
- Acrylic resins
- Etc.
The world plastic* production almost reached 350 million tonnes in 2017.

FROM WASTE TO RESOURCE
Understanding the life cycle of plastic products

In order to understand the life cycle of plastic products it is important to understand that not all plastic products are the same and not all have the same service life.
Some plastic products have a shelf life of less than one year, some others, have a lifespan of more than 15 years and some have a service life of 50 years or even more. Thus, from production to waste, different plastic products have different life cycles and this is why the volume of collected waste cannot match, in a single year, the volume of production or consumption.
In ten years, plastic waste recycling has increased by almost 80%.

From 2006 to 2016 the volumes of plastic waste collected for recycling increased by 79%, energy recovery increased by 61% and landfill decreased by 43%.

2006-2016 evolution of plastic waste treatment (EU28+NO/CH)

- Recycling: +79%
- Energy recovery: +61%
- Landfill: -43%
- Total waste collected: +11%

From 2006 to 2016 the volumes of plastic waste collected for recycling increased by 79%, energy recovery increased by 61% and landfill decreased by 43%. In ten years, plastic waste recycling has increased by almost 80%.
In 2016, 27.1 million tonnes of plastic waste were collected through official schemes in the EU28+NO/CH in order to be treated. And for the first time, more plastic waste was recycled than landfilled.

Plastic post-consumer waste treatment in 2016 (EU28+NO/CH)
Landfill bans foster higher recycling rates

Countries with landfill restrictions of recyclable and recoverable waste have, on average, higher recycling rates of plastic post-consumer waste.

PlasticsEurope is one of the leading European trade associations with centres in Brussels, Frankfurt, London, Madrid, Milan and Paris. We are networking with European and national plastics associations and have more than 100 member companies, producing over 90% of all polymers across the EU28 member states plus Norway, Switzerland and Turkey. The European plastics industry makes a significant contribution to the welfare in Europe by enabling innovation, creating quality of life to citizens and facilitating resource efficiency and climate protection. Close to 1.6 million people are working in more than 60,000 companies (mainly small and medium sized companies in the converting sector) to create a turnover of 355 bn EUR per year.

www.plasticseurope.org

EPRO is a pan-European partnership of specialist organisations that are able to develop and deliver efficient solutions for the sustainable management of plastic waste, now and for the future. EPRO members are working to optimise national effectiveness through international co-operation: by studying successful approaches, evaluating different solutions and examining obstacles to progress. By working together EPRO members can achieve synergies that will increase efficient plastics recycling and recovery. Currently 19 organisations in 14 European countries, South Africa and Canada are represented in EPRO.
